
a
CDDM control s1423687489: 40 units that cross
largest state $d_i$ (symlog)
iteration (thousands)

b
silent (solid), $d>0$ (dashed), active (dotted)
units silent at the crossing
iterations after the floor crossing (thousands)

c
random walk 0.22 (dashed), steady approach 1
CDDM default input scale
CDDM input scale 5, 20
DMTS
density
straightness $S_i$ before crossing

d
CDDM: noise-free (solid), default (dashed)
silent units (of 1,000)
iteration (thousands)

e
CDDM ladder, after each run's floor crossing
200k runs
75k runs
silent units gained per 10k iterations
recurrent noise $\sigma_{rec}$

f
CDDM control s1423687489: survival from 5k
measured
DD
EXP
STR
share not yet silent
iteration (thousands)
